

Semantics

AssuranceCasePackageBinding binds peer AssuranceCasePackages together to indicate the relationship between these AssuranceCasePackages. The bindings between AssuranceCasePackages consist of the bindings of the packages (i.e. ArgumentPackageBindings, ArtifactPackageBindings and TerminologyPackageBindings) contained in the AssuranceCasePackages, together with an optional ArgumentationPackage that asserts the relationship between +participantPackage.

Constraints

The participantPackages should be either AssuranceCasePackage or AssuranceCasePackageInterfaces.

OCL:

Issue:
SACM22-17 | self.participantPackage->forall(pp|pp.ocIsTypeOf(AssuranceCase::AssuranceCasePackage) or pp.ocIsTypeOf(AssuranceCase::AssuranceCasePackageInterface))
