Overview:

- Showing “Conveyed information flow” symbols on an activity diagram edge is not possible today.
- This is only possible using UML activity diagrams.

Benefits of adding:

- Familiar visual queue for items & information flowing between actions.
- Reduces clutter when many actions with pins are shown.
- Give a better indication of flow direction.
Summary:

- **OwningBlock.Name:Type** - Element flowing on object edge (Generalization Use case)
- **Name:Type** – (Matching Pins Use Case, with additional block properties)

UML in this example – Would like to use “Conveyed Information Flows” with SysML diagram also
Example with UAF Diagram shown
